

ACTIVITY NO. 1

REVIEW OF C++ PROGRAMMING	
Course Code: CPE010	Program: Computer Engineering
Course Title: Data Structures and Algorithms	Date Performed: July 9, 2026
Section: CPE21S1	Date Submitted: July 13, 2026
Name: Benj Federic De Leon	Instructor: Engr. Jimlord M. Quejado
1. Objective(s)	
☐ Implement basic programming and OOP in C++	
2. Intended Learning Outcomes (ILOs)	
After this module, the student should be able to: - Create code that follows the basic C++ code structure; - Implement appropriate class definition and instances based on given requirements; - Solve different problems using the C++ programming language.	
3. Discussion	
<u>Part A: Introduction to C++ Code</u> Structure of C++ Code	
Sections	Sample Code
Header File Declaration Section	#include<iostream> using namespace std;
Global Declaration Section	int count = 0;
Class Declaration and Method Definition Section	<pre>class rectangle{ private: double recLength, recWidth; public: rectangle(double L, double W); void setLength(double L); void setWidth(double W); double getPerimeter(); };</pre>
Main Function	<pre>int main(){ rectangle shape1(2, 5); std::cout << "The perimeter of the rectangle is " << shape1.getPerimeter() << ".\n"; std::cout << count << " number of objects created."; return 0; }</pre>

Method Definition	<pre>rectangle::rectangle(double L, double W) { recLength = L; recWidth = W; count++; }</pre>
-------------------	---

```

void rectangle::setLength(double L) {   recLength = L;
}
void rectangle::setWidth(double W) {   recWidth = W;
} double rectangle::getPerimeter() {   return
(2*recLength) + (2*recWidth);
}

```

It is not required for all sections to have code for every use-case. However, for best practices you would prefer to have an overall structure to follow to increase code readability and reusability.

Data Types

- d. Primary Data Type: int, float, char and void
- e. User defined data type: structure, union, class, enumeration
- f. Derived data type: array, function, pointer, reference

Local & Global Variables

```

#include <iostream> using
namespace std;
int globalVal = 0; //Global Variable

int main(){   int localVal = 5; //Local Variable
    std::cout << "Global Variable has value " << globalVal << ".\n";   std::cout << "Local Variable
has value " << localVal << ".\n";

    return 0;
}

```

Operators

Arithmetic	Relational	Logical
Addition +	Greater than >	AND
Subtraction –	Less than <	&&
Multiplication *	Greater than or equal >=	OR
Division /	Less than or equal <=	NOT !
Modulo %	Equal ==	
Increment ++	Not equal !=	
Decrement --		

Bitwise Operators

Let A = 60 and B = 13. Binary values are as follows:

```

A = 0011 1100
B = 0000 1101

```

Bitwise AND -> &	A & B	0000 1100
Bitwise OR ->	A B	0011 1101
Bitwise XOR -> ^	A ^ B	0011 0001
Bitwise Complement -> ~	~A	1100 0011

Assignment Operator

Assign a value to a variable. Example:

Assign the value 20 to a variable A.

```
int A = 20;
```

The assignment operator is a basic component denoted as “=”.

Part B: Classes and Objects using C++

To create a class use the class keyword. Syntax is:

```
class myClass { public:
    int myNum; string
    myString;
};
```

public here is an access specifier. It indicates that the attributes and methods listed under it are accessible outside the class. A simple table is provided below to summarize the access specifiers used in c++.

Specifiers	Within same class	In derived class	Outside the class
private	Yes	No	No
protected	Yes	Yes	No
public	Yes	Yes	Yes

We can then create an object from this class:

```
int main(){
    //this creates the object myClass object1;

    //this accesses the public attributes object1.myNum = 5;
    object1.myString = "Sample";

    return 0;
}
```

4. Materials and Equipment

Personal Computer with C++ IDE

Recommended IDE:

- CLion (must use TIP email to download)
- DevC++ (use the embarcadero fork or configure to C++17)

5. Procedure

ILO A: Create Code That Follows the Basic C++ Code Structure

For this activity, you have to demonstrate the use of a function prototype. The section on class declaration and method definition will be used for the function prototype and the function will be defined in the follow method definition section after the main function.

A function prototype in c++ is a declaration of the name, parameters and return type of the function before its definition. Write a C++ code the satisfies the following:

- Create a function that will take two numbers and display the sum.
- Create a function that will return whether variable A is greater than variable B.
- Create a function that will take two Boolean values and display the result of all logical operations then return true if it was a success.

Note:

- The driver program must call each function.
- The definitions must be after the main function.

ILO B: Implement Appropriate Class Definition and Instances Based on Given Requirements

In this section, the initial implementation for a class triangle will be implemented. The step-by-step procedure is shown below:

Step 1. Include the necessary header files. For this one, we only need `#include <iostream>`

Step 2. Create the triangle class. Assign it with private variables: `totalAngle`, `angleA`, `angleB`, and `angleC`.

```
class Triangle{ private:
    double totalAngle, angleA, angleB, angleC;
```

Step 3. We then create public methods. The constructor must allow for creation of the object with 3 initial angles to be stored in our previously defined variables `angleA`, `angleB` and `angleC`. Another method has to be made if the user wants to change the initial values, this will also accept 3 arguments to change the values in `angleA`, `angleB` and `angleC`. Lastly, a function to validate whether the given values make our shape an actual triangle.

```
public:
    Triangle(double A, double B, double C); void setAngles(double A,
double B, double C); const bool validateTriangle(); };
```

Step 4. Define the methods.

```
Triangle::Triangle(double A, double B, double C) { angleA = A;
```

```

    angleB = B;   angleC = C;
    totalAngle = A+B+C;
}
void Triangle::setAngles(double A, double B, double C) {   angleA = A;   angleB
= B;   angleC = C;
    totalAngle = A+B+C;
}
const bool Triangle::validateTriangle() {   return
(totalAngle <= 180); }

```

Step 5. Create the driver code.

```

int main(){   //driver code
    Triangle set1(40, 30, 110);   if(set1.validateTriangle()){
        std::cout << "The shape is a valid triangle.\n";
    } else {
        std::cout << "The shape is NOT a valid triangle.\n";   }   return 0;
}

```

Include the output of running this code in section 6. Note your observations and comments.

6. Output

Sections	Answer
Header File Declaration Section	<code>#include <iostream></code>
Global Declaration Section	No global variables or global function declarations
Class Declaration and Method Definition Section	<pre>//class name should follow PascalCase class Triangle{ private: double totalAngle, angleA, angleB, angleC; public: //constructor Triangle(double A, double B, double C); //methods void setAngles(double A, double B, double C); //validation const bool validateTriangle(); };</pre>
Main Function	<pre>int main(){ //driver code Triangle set1(40, 30, 210); if(set1.validateTriangle()){ std::cout << "The shape is a valid triangle" << std::endl; }else{ std::cout << "The shape is NOT a valid triangle. \n"; } return 0; }</pre>
Method Definition	<pre>Triangle::Triangle(double A, double B, double C){ angleA = A; angleB = B; angleC = C; totalAngle = A+B+C; } const bool Triangle::validateTriangle() { return (totalAngle <= 180); }</pre>

Table 1-1. C++ Structure Code for Answer

Table 1-2. ILO B output observations and comments.

- The code used the angles 40, 30, and 210. They add up to 280. Since 280 is more than 180, the program correctly printed that it is NOT a valid triangle.
- The setAngles function was listed in the class at the top, but the actual code for it was missing at the bottom.
- The code checks if the total is ≤ 180 . In real math, a triangle must equal exactly 180 degrees, not less.

7. Supplementary Activity

ILO C: Solve Different Problems using the C++ Programming Language

The supplementary activities are meant to gauge your ability in using C++. The problems below range from easy to intermediate to advanced problems. Note your difficulties after answering the problems below.

1. Create a C++ program to swap the two numbers in different variables.
2. Create a C++ program that has a function to convert temperature in Kelvin to Fahrenheit.
3. Create a C++ program that has a function that will calculate the distance between two points.
4. Modify the code given in ILO B and add the following functions:
 - a. A function to compute for the area of a triangle
 - b. A function to compute for the perimeter of a triangle
 - c. A function that determines whether the triangle is acute-angled, obtuse-angled or 'others.'

8. Conclusion

Provide the following:

- Summary of Lessons Learned: I reviewed how to set up a basic C++ program and how to make a simple class with public and private parts.
- Analysis of the Procedure: Constructors are helpful for setting up data right away.
- Analysis of the Supplementary Activity: The extra tasks were good practice for basic logic, like swapping numbers and doing temperature math.
- Concluding Statement / Feedback: I did a good job making the code, and running it. Next time, I need to master every syntax and make sure I don't forget to write out all my functions.

9. Assessment Rubric

--
